Drive-It™ **POWERFUL CAD INTEGRATED PRODUCT CONFIGURATOR.**

Drive-It™ design automation closes the gap between sales and engineering. Drive-It™ is fully CAD integrated, but doesn't require any advanced programming skills for creating new product configurators. Once the product configurator is ready, sales reps or engineers are able to configure new products in a few minutes.

Configuration can be done either in CAD integrated Drive-It™ session, when the 3D model and all deliverables are generated locally, or in stand alone mode when configuration parameters are sent to remote CAD server that generates the model and deliverables.

Top level configuration rules are defined into Drive-It™ script. The script feeds the user's input values into associated 3D CAD model and starts model update process. After updating, Drive-It™ starts automatically post functions for publishing the deliverables from the CAD model.

3D model, that has associated Drive-It™ script, can also be assembled into bigger assemblies containing other Drive-It

driven modules. In such cases, Drive-It™ script adapts automatically into the new contexts and works seamlessly together with the scripts of other modules. This gives great flexibility for managing and reusing modular design.

For more information about Drive-It™ please contact your local reseller or directly to program developer MP Soft Oy. Contact information of resellers is found on www.mpsoft.fi
